

# Fluid Streams Affecting Weather

An original lesson by Melissa Arroyo, Kyle Clark, P.J. Maccio, Carey Potter-Whiting, Stephanie Robinson, Diana Sayers

## Focus on Inquiry

The student will complete a series of stations in order to explain how jet streams and ocean currents influence local weather.

## Lesson Content Overview

Students will rotate through six stations in order to gain background knowledge about jet streams and ocean currents. The students will also answer questions at each station to elaborate their understanding of jet streams and ocean currents and how they affect local weather. After the stations are completed, the teacher will lead a whole group discussion to connect the student's learning to the big ideas of the lesson.

Duration	Setting	Grouping	PTI Inquiry Subskills
5 days	Classroom	3-4 students	1.3, 2.1, 3.1, 3.3, 3.6, 3.7, 4.2, 4.3, 5.1, 5.2, 5.3, 5.4, 5.9, 6.1, 6.2, 7.1, 7.2

Lesson Components	Estimated Time		Inquiry Subskills Used	Technology Used	Level of Student Engagement	Brief Description
<i>Engage</i>	5-10 min	Day 1	1.3, 2.1, 3.1, 3.6, 4.3, 5.2, 5.3, 5.4, 6.1, 6.2, 7.1, 7.2	Fan/hair dryer	3	Students will watch a volunteer and the teacher demonstrate how the airflow of a concentrated air source affects the velocity of a paper/balsa airplane.
<i>Explore</i>	90 min	Day 1-4	3.3, 3.6, 3.7, 4.2, 5.2, 5.3, 5.4, 5.9	Computer, i-Pad, Laptop	3	Students will explore how global patterns such as jet stream and ocean currents influence local weather through investigations at 6 stations.
<i>Explain</i>	90 min	Day 1-4	3.3, 3.6, 3.7, 4.2, 5.2, 5.3, 5.4, 5.9	Computer, i-Pad, Laptop	3	Students will explain how global patterns such as jet stream and ocean currents influence local weather.
<i>Expand/Elaborate</i>	15 min.	Day 5	5.2, 5.3	None	3	Students will broaden their knowledge through a whole group discussion applying their learning from the stations.
<i>Evaluate</i>	20 min.	Day 5	7.1, 7.2	None	2	Students will apply their knowledge from their learning journey to a formal evaluation.

### Level of Student Engagement

1	Low	Listen to lecture, observe the teacher, individual reading, teacher demonstration, teacher-centered instruction
2	Moderate	Raise questions, lecture with discussion, record data, make predictions, technology interaction with assistance
3	High	Hands-on activity or inquiry; critique others, draw conclusions, make connections, problem-solve, student-centered

## Next Generation Science Standards – Inquiry

- NGSS Practice 1: Identify Inquiry Questions
- NGSS Practice 2: Design Scientific Investigations
- NGSS Practice 3: Planning and Carrying Out Investigations
- NGSS Practice 4: Analyzing and Interpreting Data
- NGSS Practice 5: Explain Results and Draw Conclusions
- NGSS Practice 6: Constructing explanations
- NGSS Practice 7: Communicate Scientific Procedures and Explanations

## Next Generation Science Standards – Earth Science

**MS-ESS2-6.:** Develop and use a model to describe how unequal heating and rotation of the Earth cause patterns of atmospheric and oceanic circulation that determine regional climates.

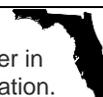

## Florida Science Standards – Nature of Science

**SC.6.N.1.1** Define a problem from the sixth grade curriculum, use appropriate reference materials to support scientific understanding, plan and carry out scientific investigation of various types, such as systematic observations or experiments, identify variables, collect and organize data, interpret data in charts, tables, and graphics, analyze information, make predictions, and defend conclusions.

## Florida Science Standards – Earth Science

**SC.6.E.7.3** Describe how global patterns such as the jet stream and ocean currents influence local weather in measurable terms such as temperature, air pressure, wind direction and speed, and humidity and precipitation.

## **Materials and Advance Preparation**

### **Materials List**

#### Class set:

- Blackline Master 1: Student WS
- Blackline Master 2: Student Assessment
- Blackline Master 3: Station Stations Questions

#### Student materials:

- Pen or pencil
- Red and blue colored pencils or crayons
- 2 Globes
- Scotch tape
- Blue string/yarn
- Arrows (from blackline master)
- Colored arrows in blue and red (arrows from blackline master)
- Paper airplane or cardboard plane
- Hair dryer/small electric fan

### **Blackline Masters**

1. **Blackline Master 1 Student WS for Stations**
2. **Blackline Master 2 Student Assessment**
3. **Blackline Master 3 Student Station Questions**

### **Advance Preparation**

1. Prepare the stations #1-6
2. Group students into 3-4 students per group
3. Place a group at each of the stations from 1-5. Leave station 6 open as it builds off of station 5.

## **Lesson Information**

### **Learning Objectives**

1. The student will be able to collect data, analyze data, collaborate and discuss their findings, compare their findings to one another, make a claim, provide evidence and justification to support their claim, and apply their findings to unknowns.
2. The student will be able to describe how global patterns such as the jet stream and ocean currents influence local weather.

### **Prior Knowledge Needed by the Students**

- Items may require the student to apply knowledge described in the NGSSS from lower grades. This benchmark requires prerequisite knowledge from SC3.E.6.1 (Demonstrate that radiant energy from the Sun can heat objects and when the Sun is not present, heat may be lost)
- Students should understand the concepts of temperature, air pressure, humidity, and convection in fluids.

### **Background Information**

- Jet streams are fast flowing, narrow, meandering air currents found in the upper atmosphere or troposphere of some planets, including Earth. The main focus of this lesson is the influence of a jet stream on Earth's weather. Jet streams are fast flowing, narrow, meandering air currents found in the upper atmosphere or troposphere of some planets, including Earth. The Polar jet stream travels in a circular pattern around the North Pole while the Gulf Stream originates near the Equator in the Gulf of Mexico and travels north up the East coast of the United States then across the Atlantic Ocean to the North Atlantic Ocean. These jet streams help produce ocean currents. An ocean current is any continuously directed movement of ocean water that flows in one of the Earth's oceans. The currents are generated from any forces acting upon the water like, Earth's rotation, the wind and convection.

## Lesson Procedure

### Engage

1. Students will watch a student volunteer and the teacher demonstrate how the airflow of a concentrated air source affects the velocity of a paper or balsa airplane.
  - a. Student volunteer holds a concentrated air source (hair dryer or a small hand-held fan turned on high) facing the teacher.
  - b. Have the students hypothesize how far the plane will travel when thrown in the direction of the fan. Average the answers. **Possible student answer is: 2 meters.**
  - c. The teacher will throw the plane towards the fan.
  - d. Record the distance to the nearest cm.
  - e. Ask the students to hypothesize how far the plane will travel when thrown in the direction away from the fan. Average the answers. **Possible student answer is: Less than a meter.**
  - f. Record the distance to the nearest cm.
  - g. **If time permits-** the teacher may wish to repeat the experiment three times to emphasize how repetition increases validity.
2. Students will discuss with their shoulder partner the differences between the two flights.
  - a. What was the original hypothesis (average) for the flight towards the fan? **Possible student answer is: 2 meters; check the average from the board**
  - b. What was the original hypothesis (average) for the flight away from the fan? **Possible student answer is: Less than a meter; check the average from the board**
  - c. Was there a difference in the answers? **Possible student answer is: 2 meters – 1 meter (subtract the smaller number from the larger number).**
  - d. Which flight actually went further – the one thrown towards the fan's air direction or the one thrown with the fan's air direction? **Possible student answer is: The flight in the direction away from the fan should be the one that went the furthest distance.**
  - e. What do you think was the reason for the difference? **Possible student answer is: The concentrated air (tailwind) helped to push the plane further. A misconception might be the force of thrust, or other extraneous variable is the cause.**
  - f. What do you think the concentrated air source represents? **A fast moving current of air. ie The (upper air; polar) jet stream.**

### Explore/Explain

1. Students will describe how global patterns, such as jet stream and ocean currents, influence local weather through investigations at 6 stations.
  - a. Station 1: Jet Stream Picture
    - i. Based on the given diagram, students will make observations and answer the following questions on their recording sheet:
      1. What do you think you are looking at in this picture? **Possible student response is: A map with numbers, arrows, and a darker shaded area, or jet stream.**
      2. What do you think the numbers represent? **Wind speed in knots.**
      3. What do you think the arrows represent? **Wind direction moving from west to east.**
      4. What do you think the shaded area on the map represents? **Jet stream.**
      5. What do you think would happen if an airplane flew through the shaded area? **Possible student response is: The plane will move faster when moving in the direction of the arrows (east) and slower when going against the arrows (west).**
  - b. Station 2: Jet Stream Around the Globe
    - i. Students will take the blue string (one student on each side) and move hands up and down to see how it reacts. Students should recognize that the jet stream works in this manner, with constant peaks and troughs.
    - ii. Wrap the blue string around the globe so that the string goes directly through the United States. Create one wave that goes through the United States. Create four more waves all around the globe and connect the two ends of the string with tape.

- iii. Take the arrows at the station and place them on the polar jet stream in the direction it is flowing. **West to East**
  - iv. Then the students will answer the following questions on their recording sheet:
    1. What do the arrows represent? **The arrows represent the direction the polar jet stream is moving.**
    2. Which direction do the arrows flow? **Students may say left to right. Remind them it is west to east.**
    3. How are the temperatures above the jet stream different from below the jet stream? **The jet stream would have cooler temperatures above and warmer temperatures below because of the arctic region.**
    4. Predict what would happen if the jet stream reversed directions? **Different parts of the world would experience a changing in their local weather.**
- c. Station 3: Jet Stream Comparison
- i. The students will be looking at three screen shots/images from “The Weather Channel” website. The three screen shots/images come from three different days of the week.
  - ii. Then the students will answer the following questions on their recording sheet:
    1. Look at all four images. What is similar in each of these pictures? **Lines, states, colors.**
    2. Look at all three images. What is different in each of these pictures? **Where the lines are dipping or located.**
    3. Which direction are the arrows pointing in all of the images? **From west to east.**
    4. Areas of low pressure are usually warm and humid weather areas. What color represents the lowest pressure conditions? **Purplish pink.**
    5. High pressure is followed by cool, dryer weather. What color represents the highest pressure on the map? **Green on map, red/burgundy on the key.**
    6. Looking at Map C (Sunday), which area of the country would be having the highest pressure? **Southwest and Northeast.**
    7. The lines that travel through both Montana and Michigan, where do they originate from? **Northwest.**
    8. Where do the lines that travel along California and Florida originate from? **Southwest.**
    9. If the lines are representing the wind in a fast moving stream, which day would be best to fly from Montana to Florida? **Sunday Why? because the wind is heading southeast.**
- d. Station 4: Ocean Currents Videos
- i. Using computers, laptops, i-Pads, etc., the students will watch the videos located on the NASA Aquarius Satellite website:  
<http://svs.gsfc.nasa.gov/cgi-bin/details.cgi?aid=3829>
  - ii. Students will need to read each of the captions underneath the videos before watching them; the captions give important information about each video.
  - iii. After watching each of the 6 videos, the students will answer the following questions on their recording sheet:
    1. What relationships did you notice between the ocean current movement and the wind movements? (video 1) **Possible student response is: They move in similar directions. Ocean currents move from warm water areas (near equator), to the west and north to cooler water areas (near the North Pole). Winds move from west to east and south to north from warmer areas to cooler areas.**
    2. How can you distinguish between the warm ocean water and the cold ocean water? (video 2) **Possible student response is: The orange and yellow are warmer waters and the white is cooler waters.**

3. Can you recognize any patterns that occur in global winds? (video 4)  
**Possible student response is: The global winds move in similar patterns of the jet stream.**
  4. How would the movement of ocean currents affect weather on land? (video 1, 2, 5, and 6) **Possible student response is: As ocean currents move warmer water from the equator up to cooler areas it will cause the surrounding areas to warm as well.**
  5. What do you hypothesize would happen if ocean currents reversed direction? **Possible student response is: If ocean currents reversed direction, then global and local weather will dramatically change. Warm would become cold and cold would become warm.**
- e. Station 5: Ocean Currents Map
- i. Students will color the warm currents that come from the equatorial region RED and the cold water currents from the Polar Regions BLUE.
  - ii. Based on the colored map, the students will answer the following questions on their recording sheet:
    1. What direction do the RED currents flow in the northern hemisphere (Where the USA is located)? **West to east.**
    2. What direction do the RED currents flow in the southern hemisphere? **East to west.**
    3. What effect do the RED currents have on the adjacent lands? **Warming.**
    4. What effect do the BLUE currents have on adjacent lands? **Cooling.**
    5. What effects would the ocean currents (both RED and BLUE) have on the ocean water and the air above the water? **Red will warm the surrounding water and the air. Blue will cool the surrounding water and air.**
- f. Station 6: Ocean Streams Around the Globe
- i. Students are to locate the Atlantic Ocean on the globe.
  - ii. Using the ocean current map from the previous station (#5), they are to tape the arrows in the correct order onto the globe starting at the equator.
  - iii. Then the students will answer the following questions on their recording sheet:
    1. What do the red arrows represent? **Warm ocean currents.**
    2. What do the blue arrows represent? **Cool ocean currents.**
    3. How would the land next to the red arrows be affected by this current? **It would bring warmer temperatures.**
    4. How would the land next to the blue arrows be affected by this current? **It would bring cooler temperatures.**
    5. What heat movement drives these currents around the Atlantic Ocean? **Convection currents.**

### **Expand/Elaborate**

- Students will broaden their knowledge through a whole group discussion applying their learning from the stations. Students will answer the following questions:
  - What did you notice was different above and below the jet stream? **Air pressure and temperature.**
  - What effect would that have on the air? **Move the air, wind.**
  - What would cause the winds to move faster? **Greater pressure difference above and below the jet stream.**
  - What temperature does a jet stream bring? **The temperature from the area it is coming from.**
  - A polar jet stream would bring what kind of temperature? **Colder.**
  - Infer what would happen in the area where the pressure differences meet. **Change in temperature, precipitation.**
  - If ocean currents are behaving like a giant conveyer belt transporting water, what would the water from the equator bring up North? **Warm, moist air.**
  - What effect would that have on the temperature and precipitation? **Higher temperature, more precipitation.**

- A cold water current was off the coast, how would that effect the summer weather? **Keep it moderate and not too hot.**
- Identify a current that would affect Florida temperature. **Gulf stream**
- What is the effect? **Bringing warm weather and moisture.**

**Evaluate****FORMAL EVALUTION**

1. Assessment

**INFORMAL or OPTIONAL EVALUTIONS**

1. Student questioning (see Explore Section)
2. Student/group handout

 \_\_\_\_\_
5. What heat movement drives these currents around the Atlantic Ocean?  
 \_\_\_\_\_

**What key idea drives both?  
 Jet Streams and Ocean Currents?**

## Blackline Master 2

## Fluid Streams Summative Assessment

- Bands of high-speed global winds found about 10 kilometers above Earth's surface that influence weather patterns are called
  - Jet streams.
  - Polar easterlies.
  - Prevailing westerlies.
  - Trade winds.
- Sharon is returning home to Miami, Florida from Seattle, Washington. Her flight to Seattle from Miami took 7 hours. The pilot has told Sharon the flight from Seattle to Miami will be about 5 hours. Why is Sharon's flight home shorter than the flight to Seattle?
  - Sharon's plane is flying in the opposite direction as the Gulf Stream which pushes the air mass toward the east making her flight move faster.
  - Sharon's plane is flying in the opposite direction as the Jet Stream which pushes the air mass toward the east making her flight move faster.
  - Sharon's plane is flying in the same direction as the Gulf Stream which pushes the air mass toward the east making her flight move faster.
  - Sharon's plane is flying in the same direction as the Jet Stream which pushes the air mass toward the east making her flight move faster.

Use the following picture to answer question 3-4. The dark area is the ocean and the lighter areas of the map are the continents.

Image from:

[https://www.google.com/url?sa=i&rc=1&q=&esrc=S&source=images&cd=&cad=rja&uact=8&ved=0ahUKewio6sqWpoXPAhXDLsYKH06NCxoQjB0lBg&url=https%3A%2F%2Fcommons.wikimedia.org%2Fwiki%2FFile%3AJet\\_Stream.jpg&psig=AFQjCNGBWRtJgKQGuQaxBsfUdUtevWIBxg&ust=1473612616205722](https://www.google.com/url?sa=i&rc=1&q=&esrc=S&source=images&cd=&cad=rja&uact=8&ved=0ahUKewio6sqWpoXPAhXDLsYKH06NCxoQjB0lBg&url=https%3A%2F%2Fcommons.wikimedia.org%2Fwiki%2FFile%3AJet_Stream.jpg&psig=AFQjCNGBWRtJgKQGuQaxBsfUdUtevWIBxg&ust=1473612616205722)

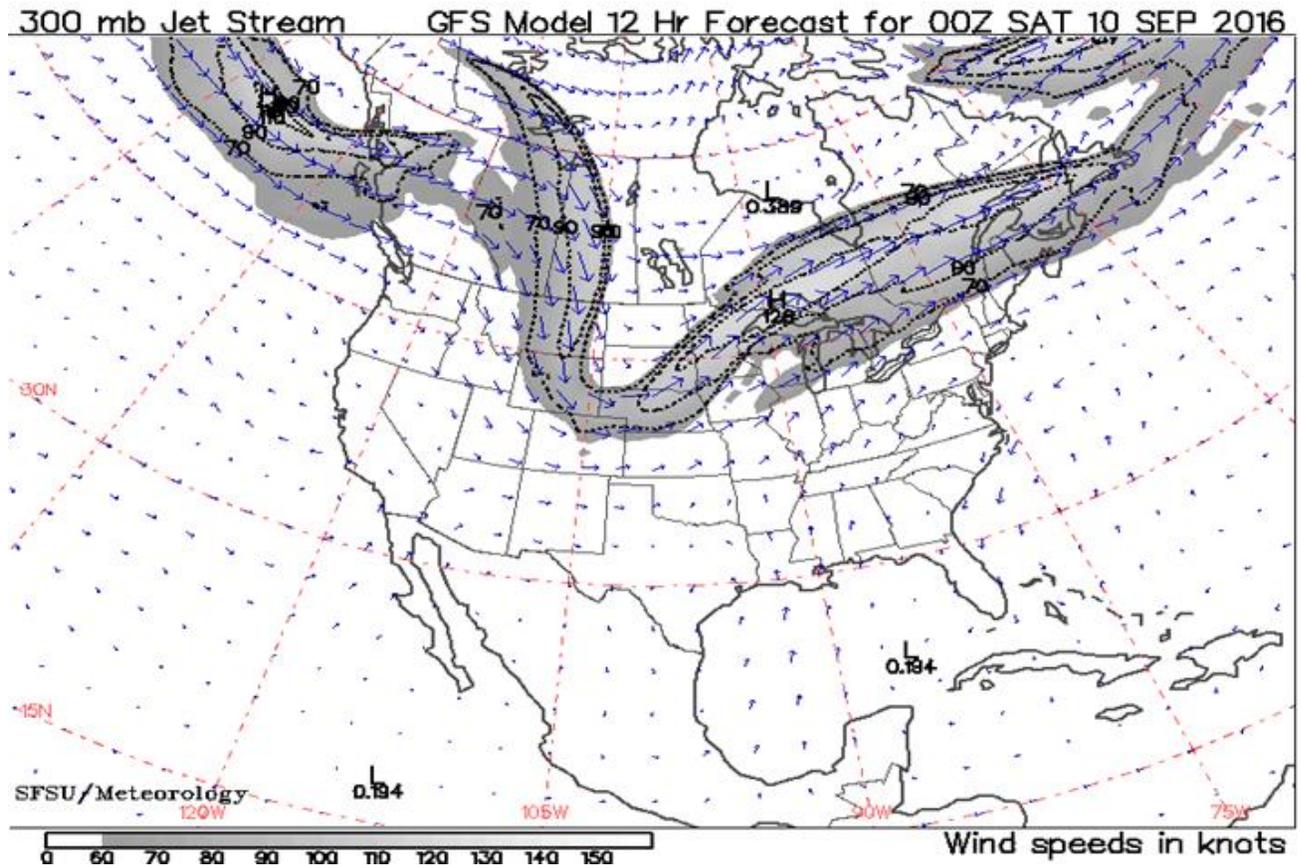

3. The Gulf Stream is a warm current that joins with the North Atlantic Drift, another warm current, as it moves across the North Atlantic Ocean. Predict how these warm ocean currents affect the climate of City X, which is near the Arctic Circle.
  - a. The climate of City X is always hot and dry.
  - b. The currents result in a cold, severe climate in City X.
  - c. The climate at City X is unaffected because it's close to the Arctic Circle.
  - d. City X has a warmer average temperature than a city at the same latitude in North America.
  
4. Currents that start near the equator and moves towards the polar zones are
  - a. Cold water currents
  - b. Convection currents
  - c. Surface currents
  - d. Warm water currents
  
5. Currents that start near the poles and moves towards the equator are
  - a. Cold water currents
  - b. Convection currents
  - c. Surface currents
  - d. Warm water currents
  
6. There is a polar jet stream and a subtropical jet stream. The polar jet stream originates in the norther territories of Canada and can dip into the mid-western states of the United States. The weather in the United States often is influenced by the by the dips and peaks of the movement of the jet streams. If the polar jet stream drops down from Canada to Georgia what type of air mass is the polar jet stream bringing with it?
  - a. Cold dry air mass
  - b. Cold wet air mass
  - c. Warm dry air mass
  - d. Warm wet air mass

**Fluid Streams Summative Assessment KEY**

1. **a.** Jet streams.
2. **d.** Sharon's plane is flying in the same direction as the Jet Stream which pushes the air mass toward the east making her flight move faster.
3. **d.** City X has a warmer average temperature than a city at the same latitude in North America.
4. **d.** Warm water currents
5. **a.** Cold water currents
6. **a.** Cold dry air mass

**Blackline Master 3**

**Station 1: Jet Stream**

Station 1: Jet Stream Picture

**Station 1 – Student Questions**

Make observations about the picture and answer the following questions:

1. Describe what you think you are looking at in this picture?
2. What do you think the numbers represent?
3. What do you think the arrows represent?
4. What do you think the shaded area on the map represents?
5. What do you think would happen if an airplane flew through the shaded area?

## Station 2: Jet Stream Globe Activity

### Station 2: Student Directions

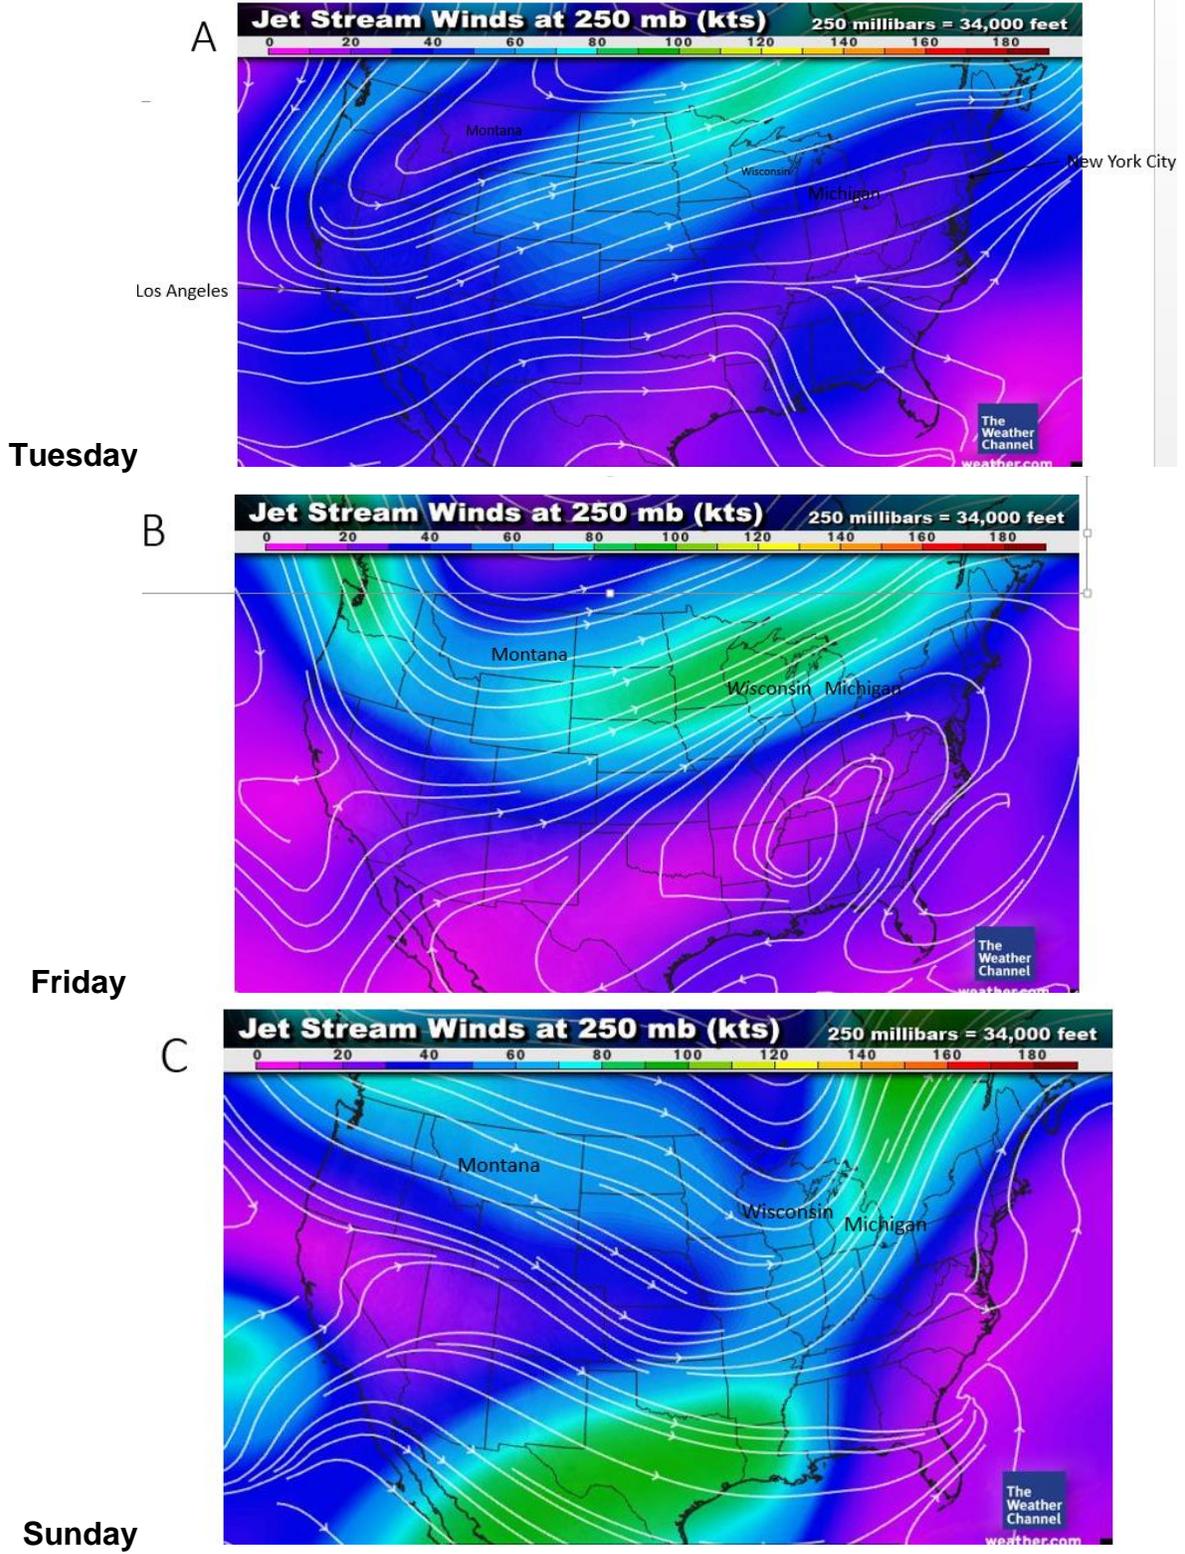

Hold the red string on one end, and have a friend hold another side. Move your hand up and down to make bumps in the string, and see how it reacts. That's the way the jet stream works, with constant bumps and dips.

Now pick up the blue string and wrap it around the globe so that the string goes directly through the United States. With the previous activity in mind create one wave that goes through the United States. Create four more waves all around the globe and connect the two ends of the string with tape.

### Station 2: Student Questions

1. What do the arrows represent?
2. Which direction do the arrows flow?
3. How are the temperatures above the jet stream different from below the jet stream?
4. Predict what would happen if the jet stream reversed directions?

### Station 3: Jet Stream Comparison Activity

Station 3: Jet Stream Comparison Pictures

### Station 3: Student Directions

In this station you will be looking at 3 screen shots from “The Weather Channel” website.

These 3 images come from 3 different days of the week. Notice the changes between the lines on the different days.

### Station 3: Student Questions

1. Look at all 3 images. What is similar in each of these pictures?
2. Look at all 3 images. What is different in each of these pictures?
3. Which direction are the arrows pointing in all the images?
4. Areas of low pressure are usually warm and humid weather areas. What color represents the lowest pressure conditions?
5. High pressure is followed by cool dryer weather. What color represents the highest pressure on the map?
6. Looking at Map C, which area of the country would be having the highest pressure?
7. The lines that travel through both Montana and Michigan, where do they originate from?
8. Where do the lines that travel along California and Florida originate from?
9. If the lines are representing the wind in a fast moving stream, which day would be best to fly from Montana to Florida? Why?

## Station 4: Ocean Currents & Global Winds Activity

### Station 4: Student Directions

1. Watch the videos located on the NASA Aquarius Satellite website.  
<http://svs.gsfc.nasa.gov/cgi-bin/details.cgi?aid=3829>
2. Make sure you are reading each of the captions underneath the videos before watching them; the captions give important information about each video.
3. After watching each of the 6 videos answer the following questions:

### Station 4: Student Questions

1. What relationships did you notice between the ocean current movement and the wind movements? (video 1)
2. How can you distinguish between the warm ocean water and the cold ocean water? (video 2)
3. Can you recognize any patterns that occur in global winds? (video 4)
4. How would the movement of ocean currents affect weather on land? (video 1, 2, 5 and 6)
5. What do you hypothesize would happen if ocean currents reversed direction?

## Station 5: Coloring the Ocean Currents

### Station 5: Student Directions

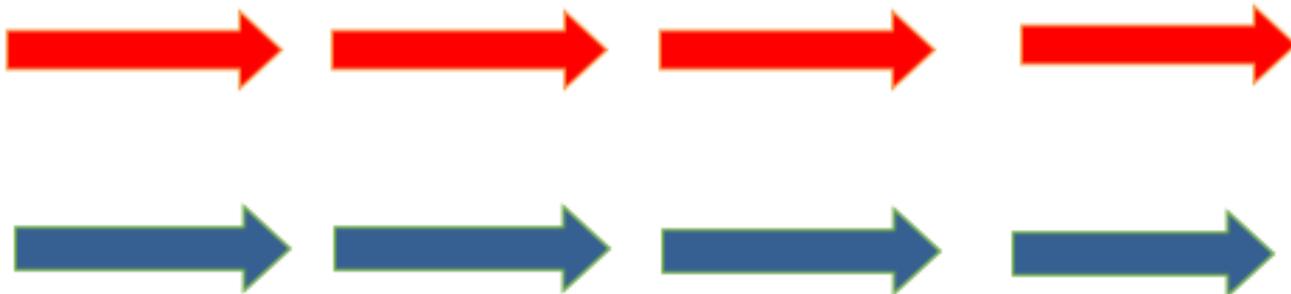

Coloring the Ocean Current. The map shows the global patterns of ocean currents.

1. Color the warm water currents that come from the equatorial regions RED.
2. Color the cold water currents from the polar regions BLUE.

### Station 5: Student Questions

1. What direction do the RED currents flow in the northern hemisphere? (Where the USA is located)
2. What direction do the RED currents flow in the southern hemisphere?
3. What effect do the RED currents have on the adjacent lands?
4. What effect do the BLUE currents have on adjacent lands?
5. What effects would the ocean currents (both RED and BLUE) have on the ocean water and the air above the water?

## Station 6: Ocean Currents Globe

### Station 6: Student Directions

Locate the Atlantic Ocean on the globe. Using your ocean current map from the previous station, tape the arrows, in the correct order onto the globe starting at the equator.

### Station 6: Student Questions

1. What do the red arrows represent?
2. What do the blue arrows represent?
3. How would the land next to the red arrows be affected by this current?
4. How would the land next to the blue arrows be affected by this current?
5. What heat movement drives these currents around the Atlantic Ocean?
